Release Notes

Prism Suite® 17.0

Prepared by the Product Management Team at New Boundary Technologies® for release with Prism Suite 17.0.0.x.

New in Prism Suite® 17.0 –Package Size Limit Increase (64bit Only), Active Directory Authentication Option for Prism Console Users, Channel Data Import/Export Directly in Console, more!

The enhancements in Prism 17.0 enable administrators to:

- Build Prism Packages larger than the previous 4.3 GB limit (64bit only);
- Allow Prism Console users to authenticate with Active Directory credentials;
- Import and Export channel data (i.e. tasks, configuration groups, users, etc..) directly from the console;
- Duplicate Prism tasks.

Package Size Limit Increase (64bit only)

In previous versions of Prism, Packages could not be larger than 4.3GB. Prism 17 removes this limit, allowing packages to be, effectively, any size (for Windows 64bit operating systems).

Prism Package Size Limit Increase

Active Directory Authentication Option for Prism Console Users

Channel administrators can now allow users the option of logging in using their Windows credentials instead of using their normal Prism channel credentials. This means users no longer have to maintain a separate password in Prism.

Active Directory User Authentication for Prism Console

Channel Data Import/Export

The Prism Console now provides a rich set of options for moving data between channels. A variety of channel data can now be imported into or exported from a channel directly within the console. This includes Tasks, Task Groups, Task Assignments, Configuration Groups, Organizational Groups, Users, Roles, and Distribution Locations. The data can be imported from another channel or file, and can be exported to multiple channels and/or to a file.
